Industrial Vibration Monitoring

The IMI Sensors division of PCB® offers a vast selection of industrial accelerometers, vibration sensors, vibration switches, vibration transmitters, switch boxes, cables, and accessories for industrial and shipboard machinery health monitoring, analysis, diagnostics, and protection. Sensors are available with choice of connector, integral cable, temperature signal output, velocity signal output, and hazardous area approvals. Determining machinery health through vibration monitoring has proven effective for maintenance planning, reducing downtime, and avoiding catastrophic loss. Whether it’s a cooling tower fan motor or a paper machine calendar bearing, we can help, with sensors that are off-the-shelf or custom designed for a specific application.

What is an “industrial” accelerometer?
Industrial accelerometers are built to endure the rigors of harsh factory environments. They are typically constructed with stainless steel housings to survive exposure to corrosive chemicals. Welded construction and hermetic sealing guard against any influx of dirt, oil, and other contaminants. Heavy duty electrical connectors are used to permit interface with strong, durable cables. Sealed, integral cables may be utilized to tolerate exposure to fluids, wash-down conditions, or submersion. Armored cables offer further protection from metal chips or being pinched or crushed.

Additionally, filtering is normally included to guard against RF interference caused by wireless communication equipment and high frequency saturation. Electrical case isolation and faraday shielding are used to protect against electromagnetic interference, surface noise pickup, and ground loop problems. Additional circuitry is normally included to guard against damage from mis-wiring and exposure to electrostatic discharge. These attributes permit industrial accelerometers to provide uncorrupted measurements and years of trouble-free, unattended service.
